

1. My Answer: $O(M)$

My reason:

According to the Sum of a Geometric Sequence: $\frac{a(1-r^n)}{(1-r)}$

$$M = 3^n$$

$$\begin{aligned} C(M) &= 1 + 3 + 9 + \dots + 3^n \\ &= \frac{3^{n+1} - 1}{3 - 1} = \frac{3^{n+1} - 1}{2} = \frac{3M - 1}{2} = O(M) \# \end{aligned}$$

2. My Answer: $O(M)$

My reason:

According to the Sum of a Geometric Sequence: $\frac{a(1-r^n)}{(1-r)}$

$$M = 11^n$$

$$\begin{aligned} C(M) &= 1 + 11 + 121 + \dots + 11^n \\ &= \frac{11^{n+1} - 1}{11 - 1} = \frac{11^{n+1} - 1}{10} = \frac{11M - 1}{10} = O(M) \# \end{aligned}$$

3. My Answer:

4. My Answer: This is impossible that problem 3 be a result of running weighted quick union.
My reason:

i	1	2	3	4	5	6	7	8	9	10
F(i)	1	2	3	4	5	6	7	8	9	10
	↓		↓	↓	↓	↓	↓	↓	↓	↓
	2		4	2	6	7	2	4	5	6

$$\begin{aligned} &\rightarrow [2, 1], [2, 4], [2, 7], \\ &\quad [4, 3], [4, 8], [7, 6], \quad \Rightarrow \\ &\quad [6, 10], [6, 5], [5, 9] \end{aligned} \quad \Rightarrow \quad \begin{array}{c} i \quad 1 \quad 2 \quad 3 \quad 4 \quad 5 \quad 6 \quad 7 \quad 8 \quad 9 \quad 10 \\ \hline F(i) \quad 2 \quad 2 \quad 4 \quad 2 \quad 6 \quad 7 \quad 2 \quad 4 \quad 5 \quad 6 \end{array}$$

5. My Answer: $O(M \log N)$

My reason

The complexity of weighted quick union is $O(\log N)$

`add_new_set()` complexity is $O(1)$

`add, add, add, u(1,3), f(2), f(3), add, add, add, u(1,4), f(5), u(6,3)`

`add, add, add, add, add, add, u(1,3), f(2), f(3), u(1,4), f(5), u(6,3)`

`add, add, u/f, u/f, u/f, add`

$$\therefore \underline{O(M \log N) + O(M)}$$

$$\therefore \text{The complexity is } \underline{O(M \log N)} \#$$
